Daji CRICKET GROUND

PROJECT BY DAJI PARIVAR

PROJECT OVERVIEW

Booking platform for dajicricket.com

A website you can open and click through today, owner and staff screens, a super-admin console, Contacts, the academy and match scoring, full accounting with bank-statement import and automatic reconciliation, Ask AI, and a page that offers the software to other ground owners. Then the Wix pages, the mobile app and the server setup that remain.

What it does, how the rules work, a flowchart for each journey, how it is built and deployed, and — plainly — what is finished and what is not.

1. Summary

Daji Cricket Ground is a booking platform for cricket grounds. Customers find a ground, pick a date and time and pay an advance. Owners and staff run the grounds from a dashboard, keep their books, and keep in touch with everyone who has played. The super admin controls the global payment switch and platform settings. Your public website stays on Wix; the booking engine runs on its own server and appears inside your Wix pages.

4
user roles

3
ways in: Wix site, iOS, Android

319
automated tests, all passing

181
API routes

What you chose

Decision	Choice
Scope	Customer website, mobile app and a backend API, plus owner, staff and admin screens
Website	Wix at **dajicricket.com**. Booking, account and accounting screens are added to Wix pages as custom elements (the same screens already run as a standalone site, section 16) loaded from **api.dajicricket.com** (section 11)
Mobile	Expo (React Native), one codebase for iOS and Android
Business model	Multiple independent ground owners; each owner sees only their own data
Payments	Razorpay (test mode first) and direct UPI/QR, with one global Razorpay ON/OFF switch and manual verification of UPI payments by staff
Backend	Node.js and TypeScript. No C#/.NET is written; .NET terms in your requests (Hangfire, Mapster, Respawn, xUnit, EF Core) were mapped to Node equivalents (section 11)
Look	"Obsidian & Champagne": near-black with champagne-gold, taken from the copper sign at the ground. Your logo with its glow removed, flat, so it sits cleanly on the page background (section 10)
How it is delivered	Rebuilt in stages; a zip after each stage

Where the code stands. Built and passing 319 automated tests: the booking backend, a complete website served by the server (booking with login, gallery, live scores, academy, owner desk, accounting screens, platform page), Contacts, the academy and parent view, match scoring, the full books with PDF, Excel and CSV export, receipt attachments, bank-statement import with automatic UPI matching, recurring entries, optional two-step sign-in, daily backups, and Ask AI. **Not built yet:** the live bank feed (Yodlee), the Wix widgets, the mobile app, the server setup, and real email, SMS and WhatsApp delivery. Section 22 lists every piece with its status.

2. The ground, the academy and the details people see

Name	Daji Cricket Ground
Tagline	Project by Daji Parivar
Contact person	Hemanshu Patel
Phone	7567156000
Email	dajicricket@gmail.com
Where	Surat (worked out from the map location: 21.1818855° N, 72.9134859° E). Map link: `https://maps.app.goo.gl/Qs2Wivwv76jt9zjG7`
Academy	**MP13 Academy**, associated with Daji Cricket Ground. Munaf Patel runs his academy under **MP13**
Website	dajicricket.com

The contact person, phone, email and academy details are global settings that the super admin can change, so a change is made once and follows everywhere. Each ground also holds its own Google Maps link, which the server checks is a real Google Maps address before saving it.

Where these appear

- **Website and app (design preview today):** a Contact section with the contact person, phone, email and a Get Directions button that opens the map link; an MP13 Academy page of its own (about, how to join, coaching staff, photos, enquiry and WhatsApp buttons) with a short teaser on the home page; the tagline under the name.
- **Booking messages:** confirmation and reminder messages end with "Directions: <map link>. Questions? Call Hemanshu Patel on 7567156000." (either part is left out if it is not set). Other messages do not carry the tail.
- **Contacts updates:** the academy has a ready-made "Tournament and academy" update template (section 7).

> **One assumption to confirm:** the city "Surat" was inferred from the map coordinates, not given by you. Tell me if the address should read differently.

3. Users and what each can do

Role	Can do	Cannot do
Customer	Search grounds, see availability, book and pay, cancel, use account credit, send enquiries, view history, set marketing consent per channel (email, SMS, WhatsApp)	See anyone else's data
Ground owner	Manage own grounds, prices, hours and blocks; see bookings, payments, customers, enquiries; Contacts and updates; Reports and the books; Ask AI; add staff and choose their permissions	See another owner's data (the API answers "not found")
Staff	Only what the owner grants (table below)	Anything not in their permission list
Super admin	Manage users, roles and permissions; the global Razorpay switch and platform settings (including the contact and academy details); platform-wide reports; audit logs. To look at one owner's books or ask Ask AI about them, the admin picks the owner first	—

Staff permissions

Permission	Allows
`manage_bookings`	View and change bookings, cancel, mark no-shows, create walk-in bookings
`verify_payments`	Confirm or reject direct UPI payments; a UPI booking cannot be confirmed without this
`record_payments`	Record cash, card, UPI or bank-transfer payments taken in person; mark manual refunds paid
`manage_enquiries`	Review enquiries, add notes, send quotations, convert to bookings
`manage_grounds`	Edit ground details, prices, hours; block slots
`view_customers`	See customer records and history, and open the Contacts list and its export
`send_broadcasts`	Preview and send email, SMS or WhatsApp updates from Contacts and see their history
`view_reports`	Read the Reports tab: Profit and Loss, Balance Sheet, Future and Past schedule
`manage_accounting`	Everything in the books: accounts, transactions, categories, journals, month sign-off (also reads the reports)

> **Ask AI follows the same permissions.** A question about money needs `view_reports` or `manage_accounting`; about bookings, `manage_bookings` or `view_reports`; about customers, `view_customers`. If you may not see it, Ask AI says which permission is missing instead of answering.

4. Features

Ref	Area	What it does
FR-01	Ground listing and search	Name, location and map link, photos, facilities, prices and live availability by date and time
FR-01a	Sign-up and sign-in	Create an account with a mobile number and a one-time code (OTP), or with an email and password. First and last names start with a capital letter and can be corrected by the owner or admin. Codes are sent through an SMS provider once one is connected.
FR-02	Availability and booking	Pick ground, date, one or more consecutive slots. Slots are held while you pay. A booking is confirmed only after payment is verified. Double booking is blocked in the database itself, not just in the screens
FR-02a	Ways to play	The customer picks a ball (red, white or tennis) and a match length, such as T20 (3.5 hours), 40 overs (7 hours) or a 4-hour match (9-1, 1-5). Sessions run back to back from opening time; the whole session is held and priced as one booking.
FR-02c	Price list	Each ground has an editable price list for the leather ball, the tennis ball and practice sessions: fixed sessions (e.g. 10 am to 6 pm for one price), by-the-hour prices (e.g. 7 pm to 3 am), two-day tournaments, closed days (every Monday) and a "call for custom days" message. Owners and the super admin edit it in plain screens with a week-at-a-glance preview.
FR-02d	Part-sessions today	A fixed session that has already started today is still sold if the hours left are free, for that share of the price rounded up to the next ₹50 (for example a ₹7,000 day session with 5 of 8 hours left costs ₹4,400). A booking blocks only its own hours, so a two-day tournament leaves the late-night slots open.
FR-02e	Owner approval	Every online booking waits for an owner to approve it. The deposit holds the slot and the customer sees "Pending approval" in their dashboard until it is approved. Owners see a "Waiting for your approval" list with Approve and Decline.
FR-02f	Cancelling and refunds	A customer who cancels in time chooses: refund to the original payment method of 50% of what was paid, or the full amount as account credit for future bookings. When the ground cancels, the owner must write an explanation; the customer then chooses a full refund, the full amount as credit, or another slot.
FR-02h	Promo codes	Owners and the super admin build discount codes: typed by hand or generated (including one-time codes). Each takes a percentage (with a cap) or a rupee amount off, with optional minimum, dates and use limits. Customers enter the code when booking and see the saving before they pay.
FR-02i	Booking window and closed days	The owner or super admin sets the first day customers can book (14 Nov 2026) and a closing day (1 Jun 2027), and can switch off single days for the ground, practice nets or academy. Staff can still book closed days by hand.
FR-02j	Repeating bookings	A customer can repeat a booking daily, weekly, monthly or yearly (up to 60, 52, 12 or 3 times). The first date is paid as usual and the rest are reserved and confirmed with it; closed or taken dates are skipped and listed, and unpaid repeats can be cancelled in one step.
FR-02k	Auto-debit	Off until the owner switches it on. A customer approves their bank once (UPI AutoPay through Razorpay) and the balance of each booking is charged a set number of hours before it starts. Failed charges are retried three times and the customer is told. Needs Recurring Payments on the Razorpay account.

FR-02l	Tasks with camera proof	The owner gives staff tasks. Staff close a task with photos taken on the spot; a photo is refused unless its camera time is within the last 5 minutes, so old or forwarded pictures cannot be used.
FR-02m	Email through Gmail	Messages go out from dajicricket@gmail.com using a Google App Password; they wait in a queue until it is set.
FR-02n	Coach screens in the app	Staff with the academy and matches permissions mark attendance, keep the student list, write and publish monthly report cards, and score matches ball by ball from the phone.
FR-02i	Terms and conditions	A terms page covers booking approval, customer cancellation, ground cancellation and weather. When the ground cancels, the owner chooses which of full refund, 50% refund or credit the customer is offered.
FR-03a	Roles	The software owner (super admin) sees everything and can look at any owner's bookings and accounting. An owner runs their own ground. An Admin, added by the owner, has fewer rights than the owner: day-to-day work and reading reports, but not the books, prices, promo codes, team or settings.
FR-03b	Desk pages and profile	Every desk tab and sub-page has its own address. A round profile button at the top right shows the person's initial or chosen picture and opens their profile (name, email, mobile, picture, password, sign out). Owners, staff and admin sign in with email or mobile number.
FR-03c	Services and connections	A notebook of every outside service (WhatsApp, MSG91, Razorpay, Expo, Wix, domain, hosting, Claude) with the email and phone each account was opened with, plus a Connections list that shows what each service still needs and tests it. New services plug into the same list.
FR-02g	Push notifications	The mobile app alerts owners and staff when a booking needs approval or a customer cancels, and alerts customers when a booking is approved or the ground cancels.
FR-01b	Sign-in codes	Codes are sent by WhatsApp first, with MSG91 text message as the backup.
FR-02b	Coaching staff	The academy lists its coaches (name, title, short bio, photo), edited by academy staff and shown on the website.
FR-03	Payments	Razorpay, direct UPI/QR and offline (cash, card, bank transfer). Amount, method, status, reference and who verified are stored with a history of every change
FR-04	Global payment switch	Super admin turns Razorpay ON or OFF once; website and apps follow immediately. OFF means UPI ID or QR with staff verification
FR-05	Advance and expiry	Configurable advance (fixed or percent) and hold deadlines. Unpaid holds are released only after checking for pending or late payments. Every expiry, release and status change is audited
FR-06	Cancellation and credit	More than 24 hours before start: free cancellation. Inside 24 hours: the paid amount becomes account credit (100 percent by default). No-show: nothing back. Every credit issue, use, adjustment and expiry is in a ledger
FR-07	Enquiries and quotations	Customers ask; staff follow up, send a quotation and convert to a booking or close it
FR-08	Customers and consent	Profiles, histories, and separate optional marketing consent for email, SMS and WhatsApp. Booking and payment messages do not depend on marketing consent
FR-09	Notifications	Booking, payment, hold expiry, cancellation, credit and enquiry messages are recorded and sent through a provider interface (section 14 says what is not connected)

FR-10	Owner and staff dashboard	Grounds, prices, hours, bookings, walk-ins, offline payments, UPI verification, enquiries, customers
FR-11	Super admin dashboard	Users, roles, global settings, platform reports, audit log
Added	**Contacts**	Everyone who has played, with filters; a preview-then-send email, WhatsApp or SMS update with a consent check on every person; history; one-click unsubscribe for email; CSV export (section 7)
Added	**Reports**	Profit and Loss, Balance Sheet, Trial balance, general ledger, **Future schedule** and **Past schedule**, all from one set of books, each exportable to PDF, Excel and CSV (section 8)
Added	**Accounting**	Bank and cash accounts, transactions, categories, manual journals, month-end sign-off. Statement import, receipts, reconciliation and recurring entries are built (section 18); the live bank feed is not
Added	**Academy and match day**	Batches, students, attendance, fees and progress with a parent view; live scoring ball by ball and a public Live scores page (section 17)
Added	**Platform page**	"For ground owners": the software offered to other owners, with an enquiry form and a leads list for the super admin (section 20)
Added	**Ask AI**	Type a question in plain words ("revenue for the past 37 days", "what's the account balance") and get an answer from your own books, with the exact dates used (section 9)

5. Rules and the numbers behind them

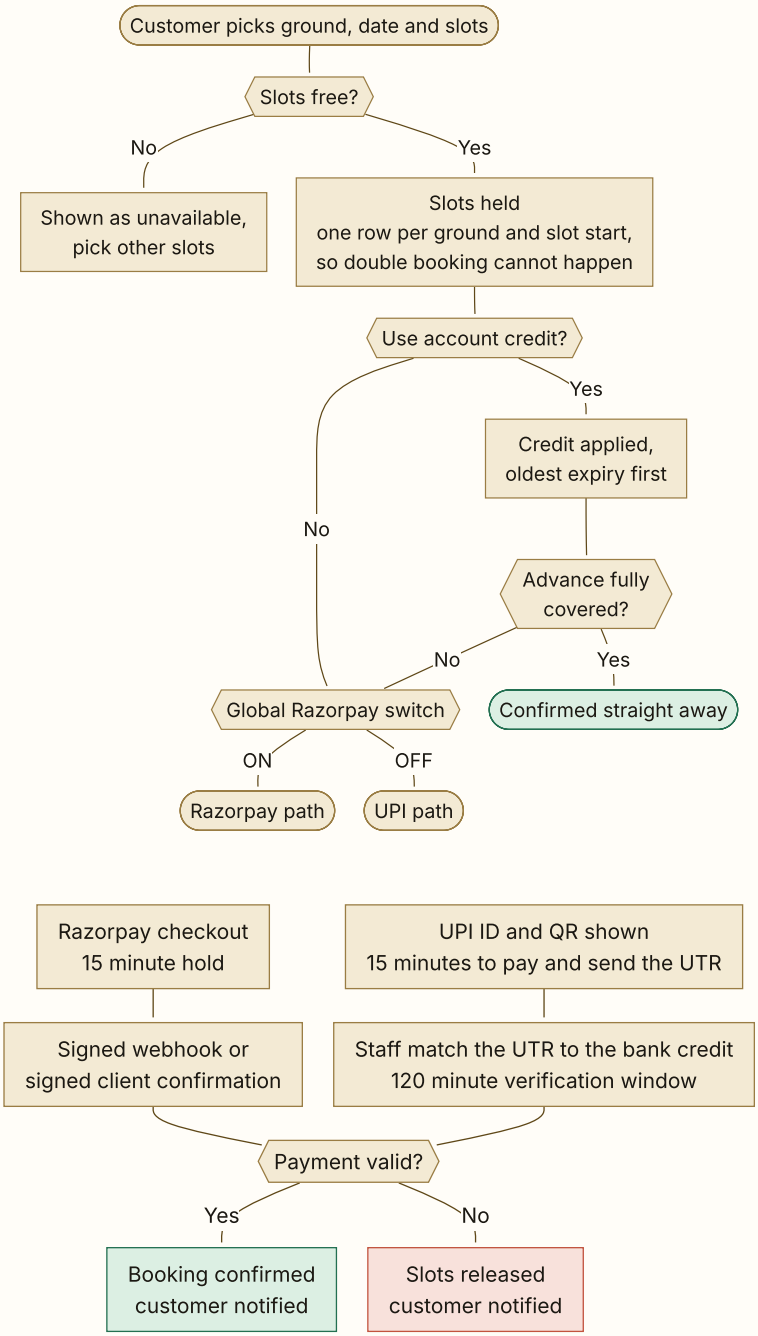

The SRS leaves several decisions open (its section 10). The values below are the defaults used so the system can run; every one is a setting the super admin can change, and every one needs your confirmation before launch.

Decision	Default used	Notes
Advance payment	50 percent of the booking total	Fixed amount or percent, global with a per-ground override. Full payment required when the booking starts within 24 hours
Hold time (online)	15 minutes	Slots are held while the customer pays
Hold time (UPI)	15 minutes to pay and submit the UTR, then 120 minutes for staff to verify	Staff verify by matching the UTR to the bank credit
Grace for late payments	10 minutes, at most 2 extensions	A payment still pending at expiry extends the hold once per extension and flags the booking for staff review
24-hour boundary	Exclusive: exactly 24 hours before start counts as "within 24 hours"	Measured from the scheduled start
Credit amount on late cancellation	100 percent of what was paid	Lower it to keep a late-cancel fee; the part kept is recorded as income on the cancellation day
Credit expiry	90 days	Oldest-expiring credit is used first. Expired credit is written off to income in the books
Refunds on free cancellation	Razorpay: automatic to the original method. UPI, cash: staff pay out and record the reference	The customer may choose credit instead of a refund
No-show	No refund, no credit	Staff mark it after a 30 minute grace period; the advance is kept as income
GST	Treated as **inside** the booking price; the owner sets the percent (0 to 28) in the accounting settings	The GST inside each played booking is shown as "GST payable" and left out of income. Confirm that your prices include GST
Communications providers	Not chosen	Messages are recorded; real sending needs your email, SMS and WhatsApp providers
Privacy policy, terms, invoice format	Not written	These still need your text

> Money is stored in whole paise and times as exact instants, so there is no rounding drift. Dates and times are shown in IST. The Indian financial year (1 April to 31 March) is used wherever a report says "this financial year".

6. Journeys as flowcharts

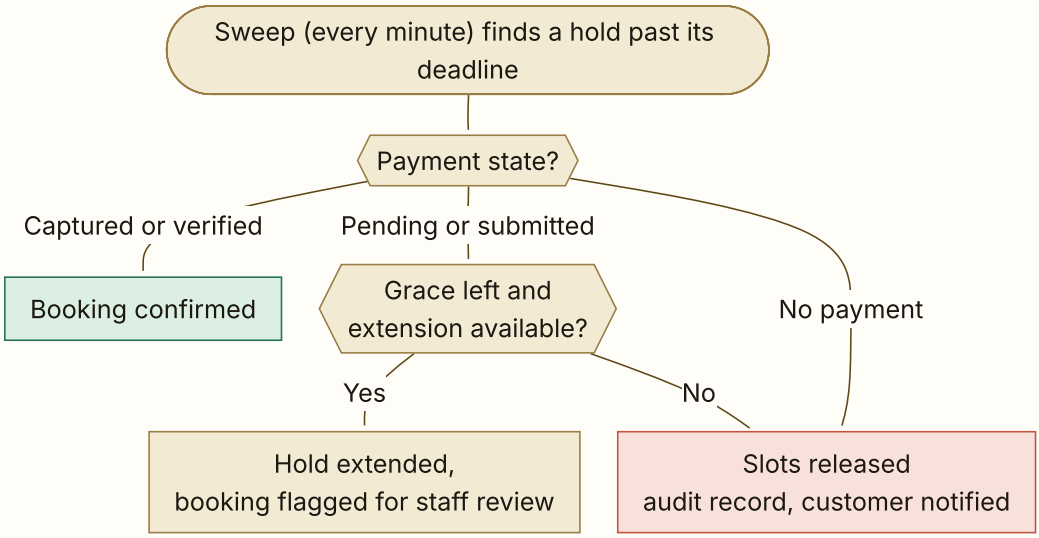

6.1 Booking and payment

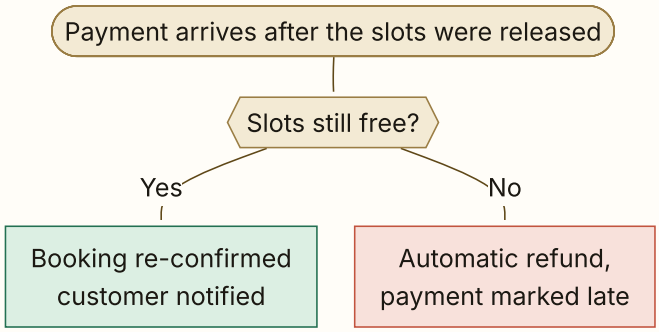

Same on the website and in the apps. The global switch decides Razorpay or UPI when the slots are held; a UPI booking cannot be confirmed without an authorised verifier.

6.2 Unpaid holds and late payments

A hold is never released just because its timer ran out: the system first looks for a pending or late payment. A late payment either re-confirms the booking or is refunded.

At the deadline.

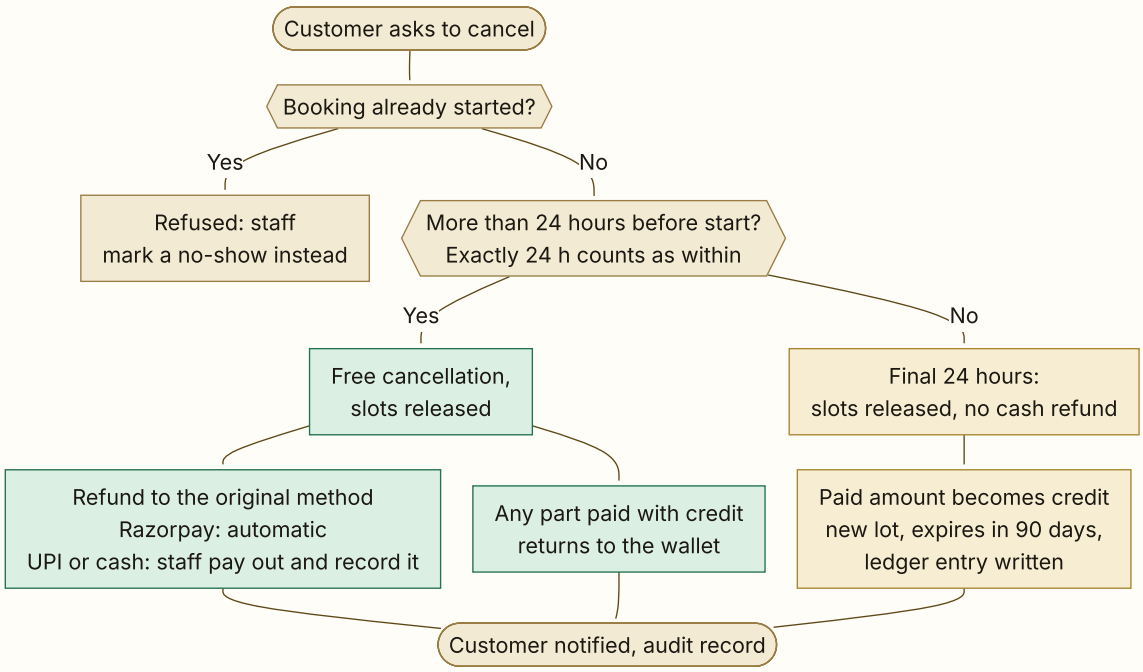

After release.

What the sweep does

Payment found at the deadline	Action	Booking becomes
Captured or verified	Confirm the booking	confirmed
Pending or submitted, grace and extensions left	Extend the hold by the grace period (10 minutes), flag for staff review	held, flagged
None, or pending with extensions used up	Release the slots, notify the customer	expired
Arrives later, slots still free	Re-confirm the booking	confirmed
Arrives later, slots taken	Refund automatically and mark the payment late	expired

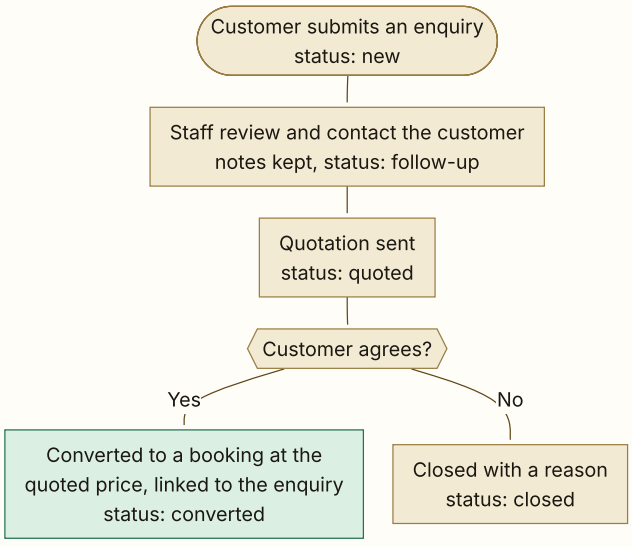

6.3 Cancellation, credit and no-show

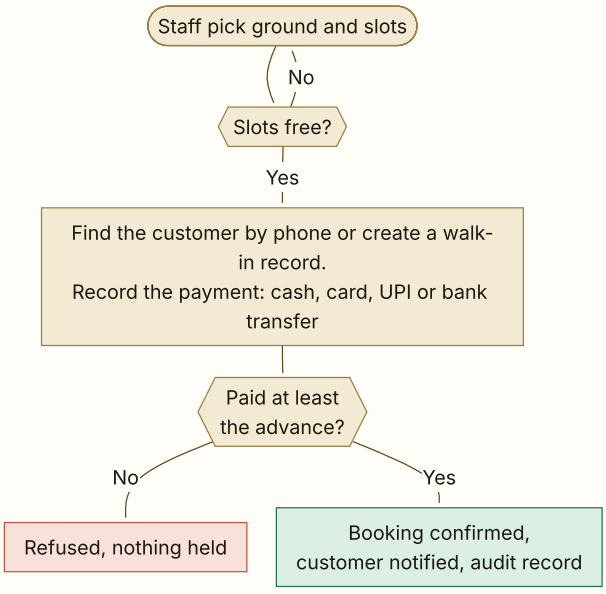

Credit is kept in lots with their own expiry dates, so the ledger always explains the balance.

> **No-show:** staff mark a booking as a no-show after the grace period. There is no refund and no credit, and the advance is kept as income.

6.4 Enquiry to booking

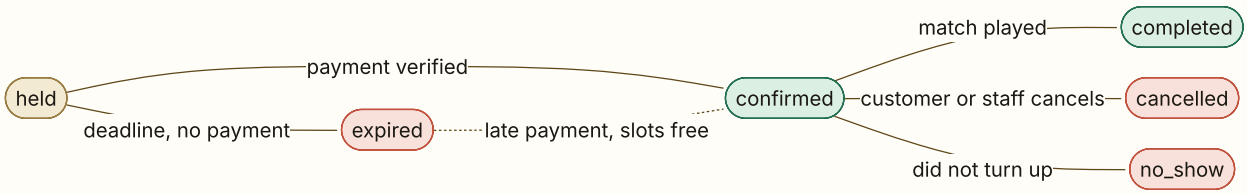

6.5 Walk-in and manual booking

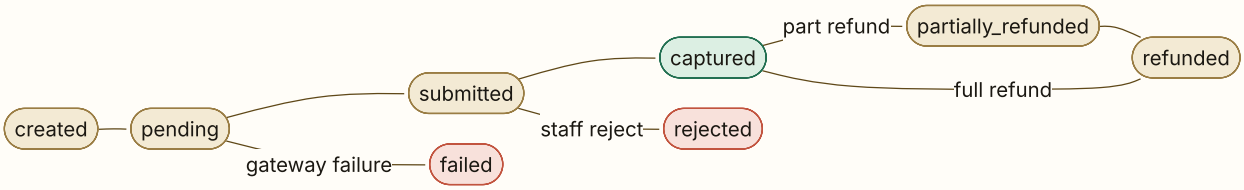

No slot is held without payment: a walk-in is confirmed only once the advance is recorded.

6.6 Status of a booking and of a payment

Booking statuses. Every change is written to the audit log.

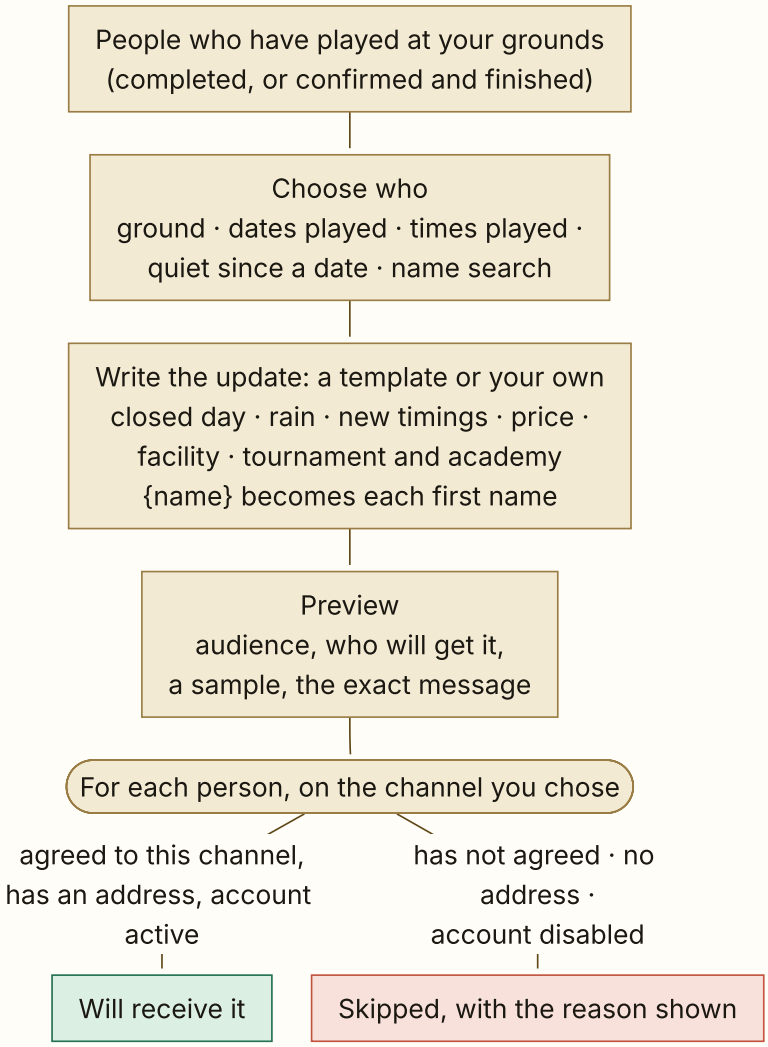

Payment statuses. Every change is also kept in the payment's own history.

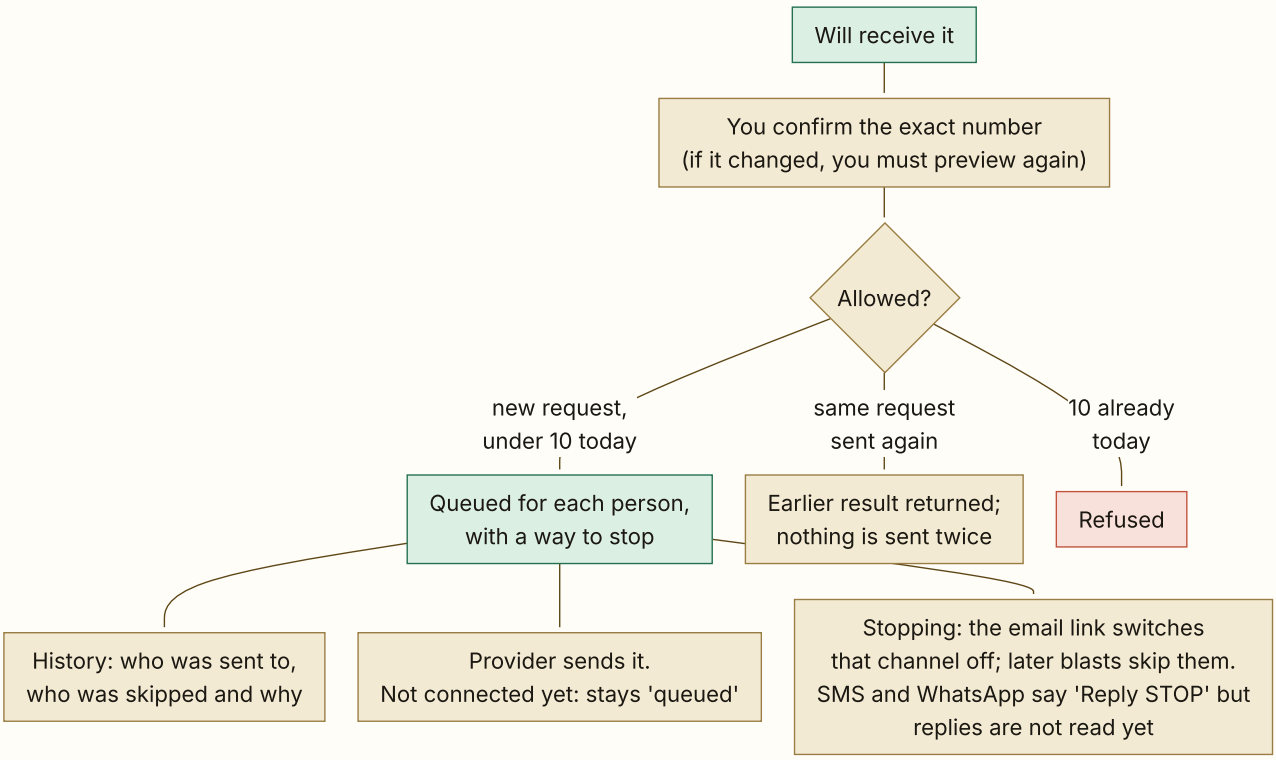

7. Contacts and updates to everyone who has played

The Contacts tab lists everyone who has played at your grounds and lets you send them an update — a closed day, rain, new timings, a price change, a new facility, a tournament or academy news — by email, WhatsApp or SMS. These are marketing-style messages to customers, so each person's own consent for each channel is checked before anything is sent.

7.1 Choosing who, and who will actually receive it

7.2 Sending, and what happens next

7.3 What the Contacts tab shows and keeps

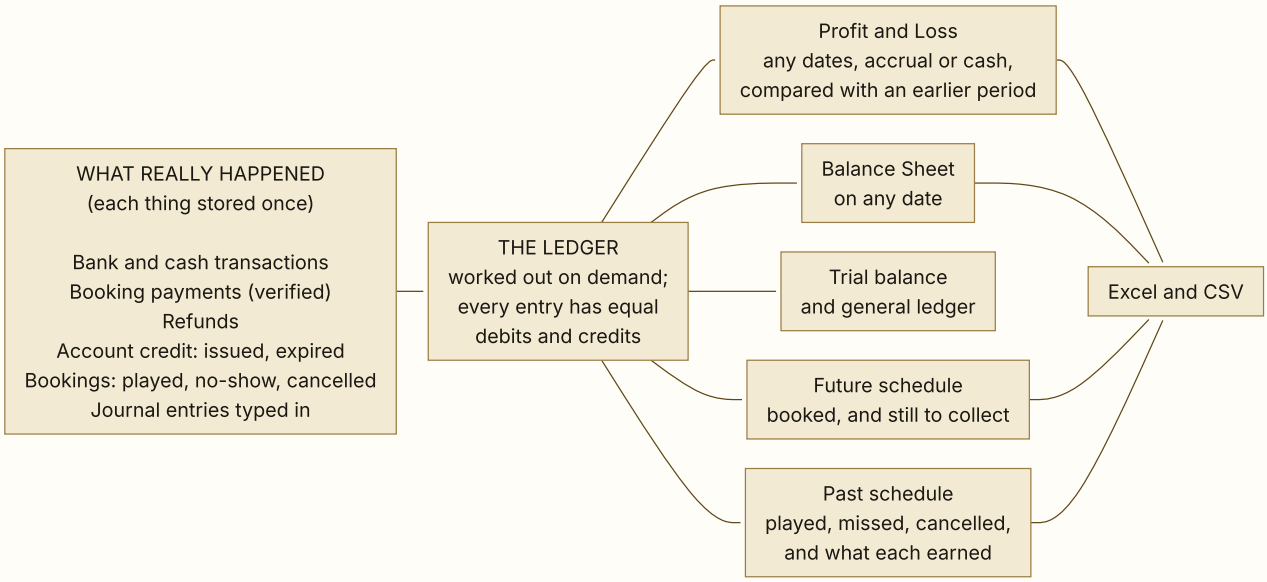

Item	Detail
Who counts as "played"	A booking that is completed, or confirmed and already finished. You can also list "everyone who booked" or everyone including no-shows
Each person	Name, phone, email, times played, slots, total paid, first and last session, grounds played at, and which channels they have agreed to
Filters	Ground, played between two dates, played at least N times, not played since a date, name or contact search
Templates	Ground closed, rain update, new timings, price change, new facility, tournament and academy. `{name}` becomes each person's first name
Message limits	Email: subject of at least 3 characters and a body of at least 10. WhatsApp: 10 to 900 characters. SMS: 10 to 300 characters
Safety checks	You must preview first and confirm the exact number of people; if the audience changed, you are asked to preview again. At most 10 updates per owner in 24 hours, so a mistake or a stolen login cannot spam the whole list. Sending the same request twice sends nothing twice
Audience size	Up to 5,000 people in one update
History	Every update: channel, text, who it was aimed at, how many were queued, and each person's status or the reason they were skipped
Export	The contact list as a spreadsheet file
Stopping	Every email carries a link to stop that channel. The link opens a confirmation button first (so mail scanners that "click" links cannot unsubscribe people by accident). Customers can also switch each channel on or off in their account

Known gap: "Reply STOP". SMS and WhatsApp updates end with "Reply STOP to stop these messages", but nothing reads replies yet. That needs the inbound-message hook of whichever WhatsApp or SMS provider you choose. Until then, a customer who replies STOP has to be switched off by staff, or can switch it off in their account. Please keep this in mind before sending WhatsApp updates at volume.

Nothing is actually sent yet. No email, SMS or WhatsApp provider is connected, so updates are recorded as **queued**. The queueing, consent checks, limits and history are all working and tested; delivery starts when you choose providers.

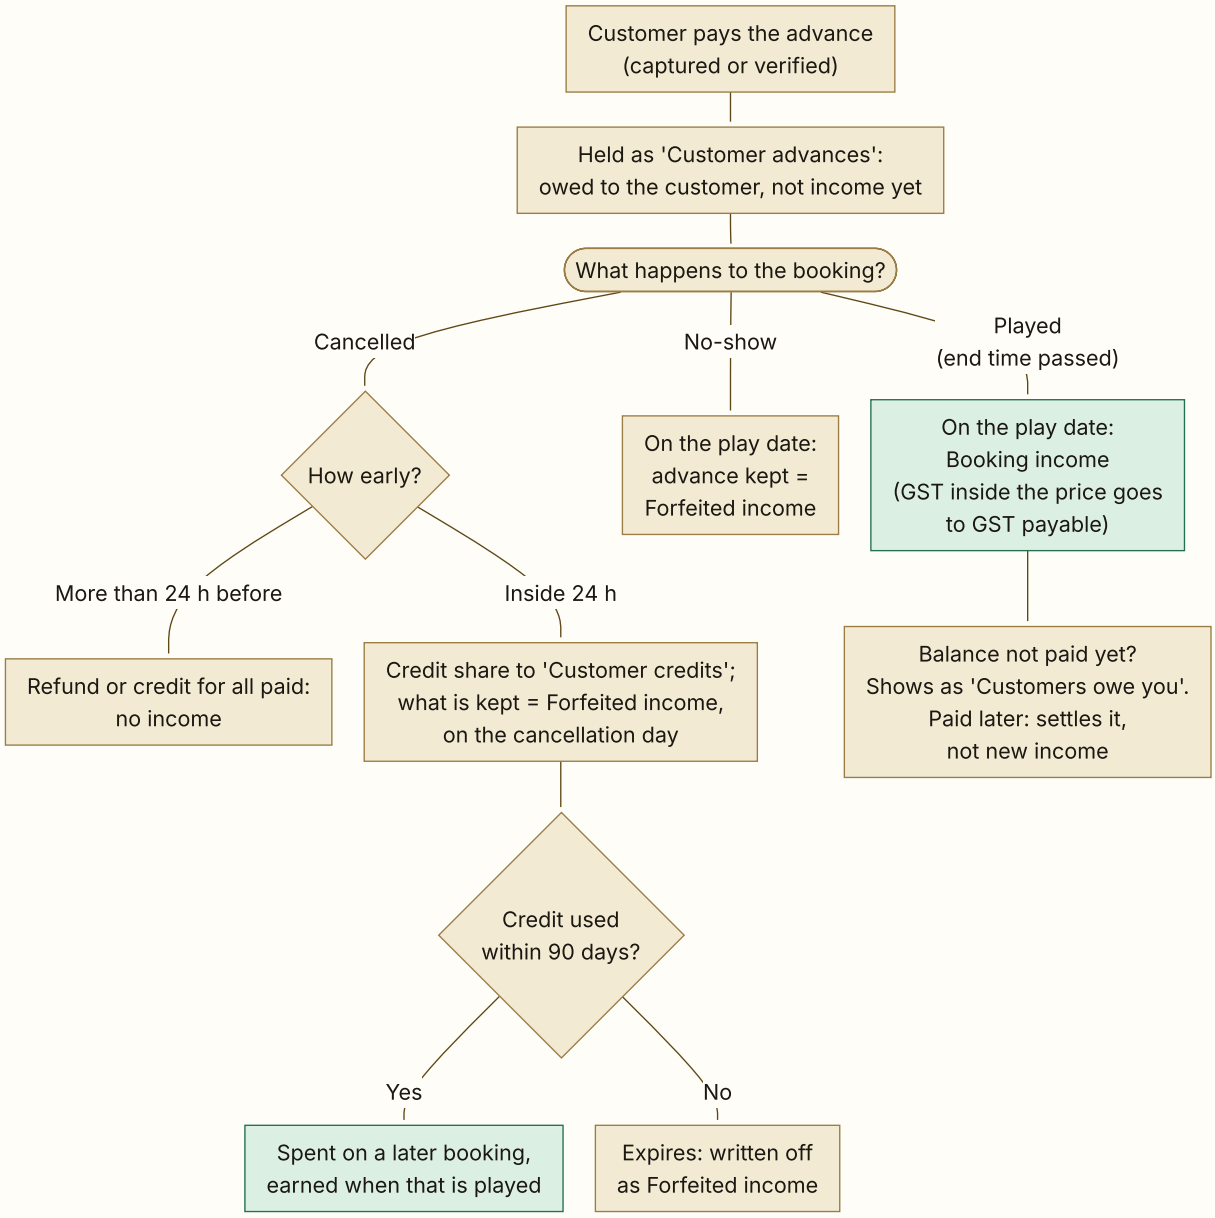

8. The books and Reports

Every figure in Reports comes from **one set of books** that is worked out on demand from the real records: bank and cash transactions, booking payments, refunds, account credit, the bookings themselves, and any journal entries an owner types in. Nothing is stored twice, and every entry has equal debits and credits, so the reports cannot disagree with each other: the Balance Sheet always balances (assets equal liabilities plus equity), and the Future and Past schedules tie to the Profit and Loss and the Balance Sheet.

8.1 When a booking counts as income

A customer's advance is not income when it arrives: it is money held for a session not yet played. It becomes income on the play date.

Customer pays the advance (captured or verified)
Held as 'Customer advances': owed to the customer, not income yet
What happens to the booking?
Cancelled
No-show
Played (end time passed)
How early?
On the play date: advance kept = Forfeited income
On the play date: Booking income (GST inside the price goes to GST payable)
More than 24 h before
Inside 24 h
Refund or credit for all paid: no income
Credit share to 'Customer credits'; what is kept = Forfeited income, on the cancellation day
Balance not paid yet? Shows as 'Customers owe you'. Paid later: settles it, not new income
Credit used within 90 days?
Yes
No
Spent on a later booking, earned when that is played
Expires: written off as Forfeited income

The Books tab is laid out like a bookkeeper's workspace: a side menu, a **+ New** menu for adding things, an overview of cards, a Bank transactions page with account cards and Pending / Posted tabs, a Books review page, and a Reports list with favourites. Every report has a Print button and an Export menu (PDF, Excel, CSV). Added reports: profit and loss by month and by quarter, customer balances with aging, audit log, general ledger.

8.2 The five reports

Report	What it shows
Profit and Loss	Income and expenses for a month or any dates (up to two years). **Accrual** basis by default: a session is income on the day it is played. **Cash** basis is available too. Optionally compared with the previous period. Bookings income is shown without GST; advances kept on no-shows and late cancellations, and credit that expired, are shown separately
Balance Sheet	As at any date: cash and bank, money online and by UPI not yet in the bank, booking balances customers owe you, equipment, then what you owe — customer advances for sessions not yet played, account credit owed to customers, refunds owed, GST payable, bills, loans — and owner equity. Unreviewed bank lines sit under "Needs attention" until categorised
Trial balance and ledger	Every account with its debit and credit totals, and a line-by-line ledger for any one account for any dates, with where each line came from
Future schedule	Confirmed bookings still to be played (a session in progress is flagged), unpaid holds, how much of the money is already held as advances, credit outstanding, and refunds owed. Grouped by day, week (Monday to Sunday) or month, and by ground. Defaults to today and the next 90 days
Past schedule	Sessions played and no-shows by play date, and cancellations by the day they were cancelled, with the money each earned: collected, still outstanding, advances kept, cancellations credited, refunded or kept, and credit that expired. The earned money is read from the same books, so it ties to the Profit and Loss. Defaults to the last 30 days

- **Exports:** each report downloads as a PDF, an Excel workbook (with working totals) or CSV. The schedule CSV is the plain list of sessions. Text that looks like a spreadsheet formula is neutralised so a hostile narration cannot run in Excel.
- **Limits:** a schedule covers at most 366 days at once; exports hold up to 20,000 rows.
- **Month sign-off:** a month can be signed off once it is over and every bank line in it is categorised. A signed-off month is locked; reopening needs a reason. Mistakes in a signed-off month are fixed with journal entries, which are voided rather than deleted.
- **Manual journals:** an owner can type in entries (depreciation, a loan, an owner's capital), but not into accounts that come from real data (bank, customer advances and credit, booking income), because a typed entry would break the tie to the real records.
- **Who sees it:** read with `view_reports` or `manage_accounting`; change with `manage_accounting`.

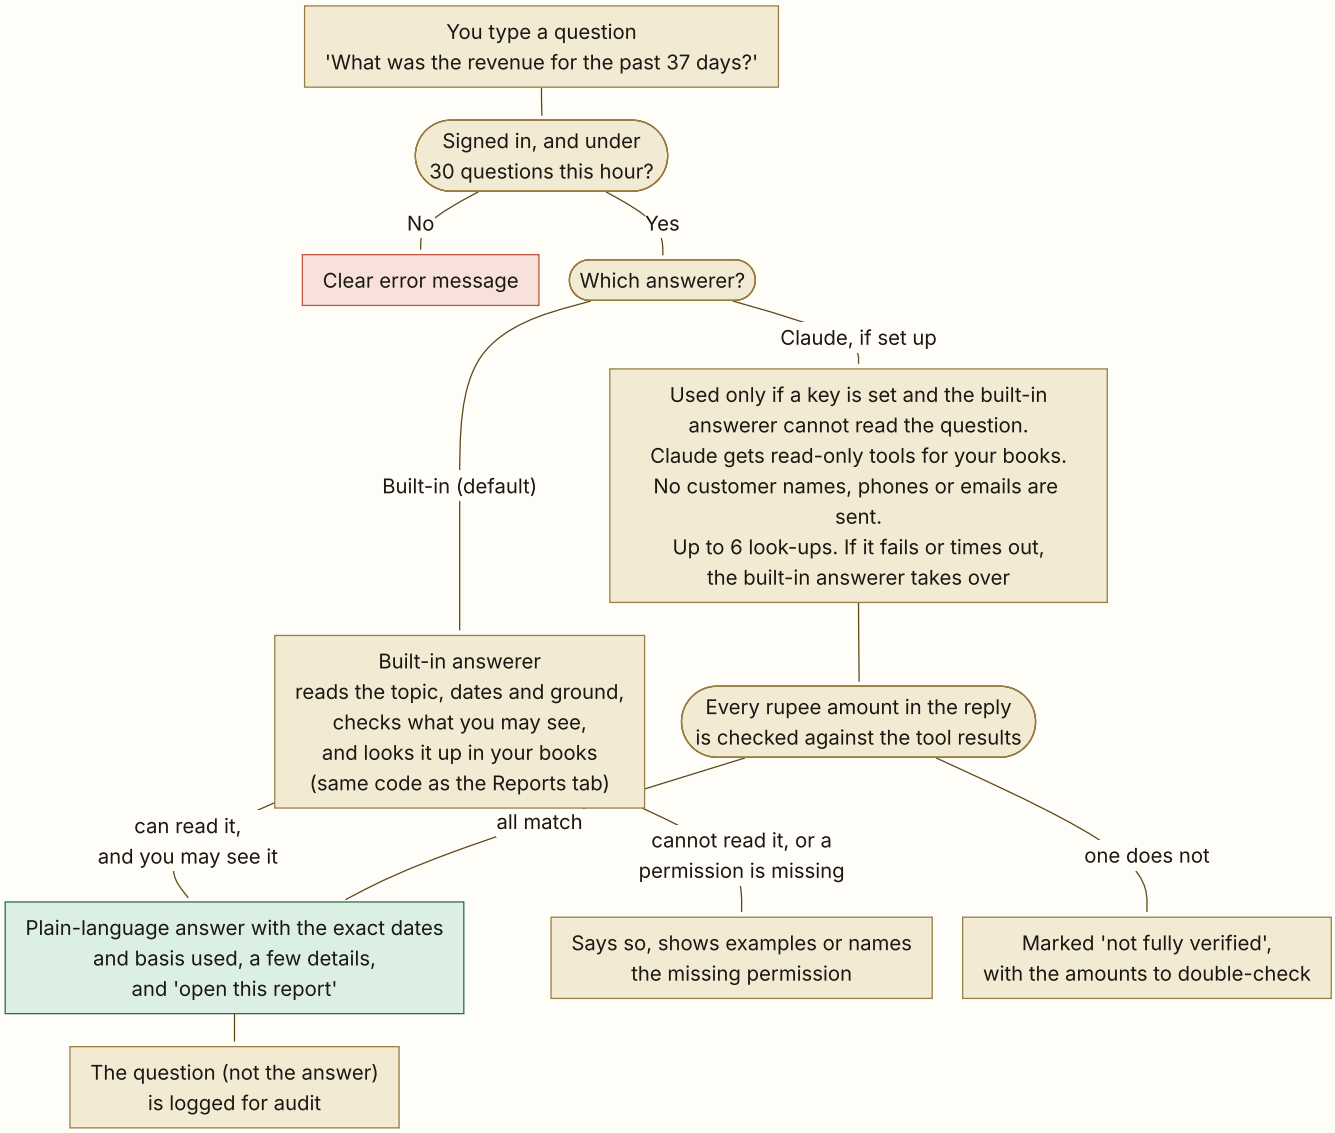

> **Screens exist.** The owner desk has a Books tab with nine sub-tabs (section 18). The desk's Today tab shows only today's figures; everything older is in Books and Reports.

8.3 Bank transactions, receipts and reconciliation Built

Described in section 18. Statement upload (CSV and Excel), de-duplication, categorising rules, automatic UTR matching of UPI money against the bank, receipt attachments and recurring entries are working. The live bank feed through Yodlee is not.

9. Ask AI

A question box inside the software for quick information you would otherwise open a report to find. Examples it understands today: *"What was the revenue for the past 37 days?"*, *"What's the account balance?"*, *"Profit this month compared with last month"*, *"Who owes us money?"*, *"What's booked for the next 7 days?"*, *"How many no-shows last week?"*, *"GST this financial year"*.

9.1 How it answers

Point	Detail
Same numbers as Reports	The built-in answerer calls the same code as the Reports tab. For example the revenue for the past 37 days equals the Profit and Loss for those 37 dates, and the answer says *"18 Sep to 24 Oct 2026"* so you can see exactly what was used
Says what it assumed	No dates given: it says which period it used. Revenue and money received are different things and the answer says which it gave ("money received" counts cash and advances, "revenue" counts sessions played)
Reading dates	"Past 37 days" is 37 days ending today, including today. "Last month" is the previous calendar month; weeks run Monday to Sunday; "financial year" is April to March; day/month/year is read the Indian way; "since 1 September" runs to today; "all time" starts on the first day anything was recorded. Dates that have not happened are explained, with what is booked instead. Impossible dates (such as 31 February) are explained, not guessed
Topics	Revenue, expenses, profit, the whole Profit and Loss (with comparison), money received, bank and cash balances (today or on an earlier date), Balance Sheet, GST, uncategorised transactions, bookings, upcoming sessions (with who and what is still to collect), money owed, payments awaiting verification, no-shows, cancellations, utilisation, account credit, refunds, customers, and a named ground ("at the nets")
When it cannot read a question	It says so and shows examples; it never guesses a number
Open the report	Each answer says which report to open for the full picture

9.2 Optional: Claude for questions the built-in answerer cannot read

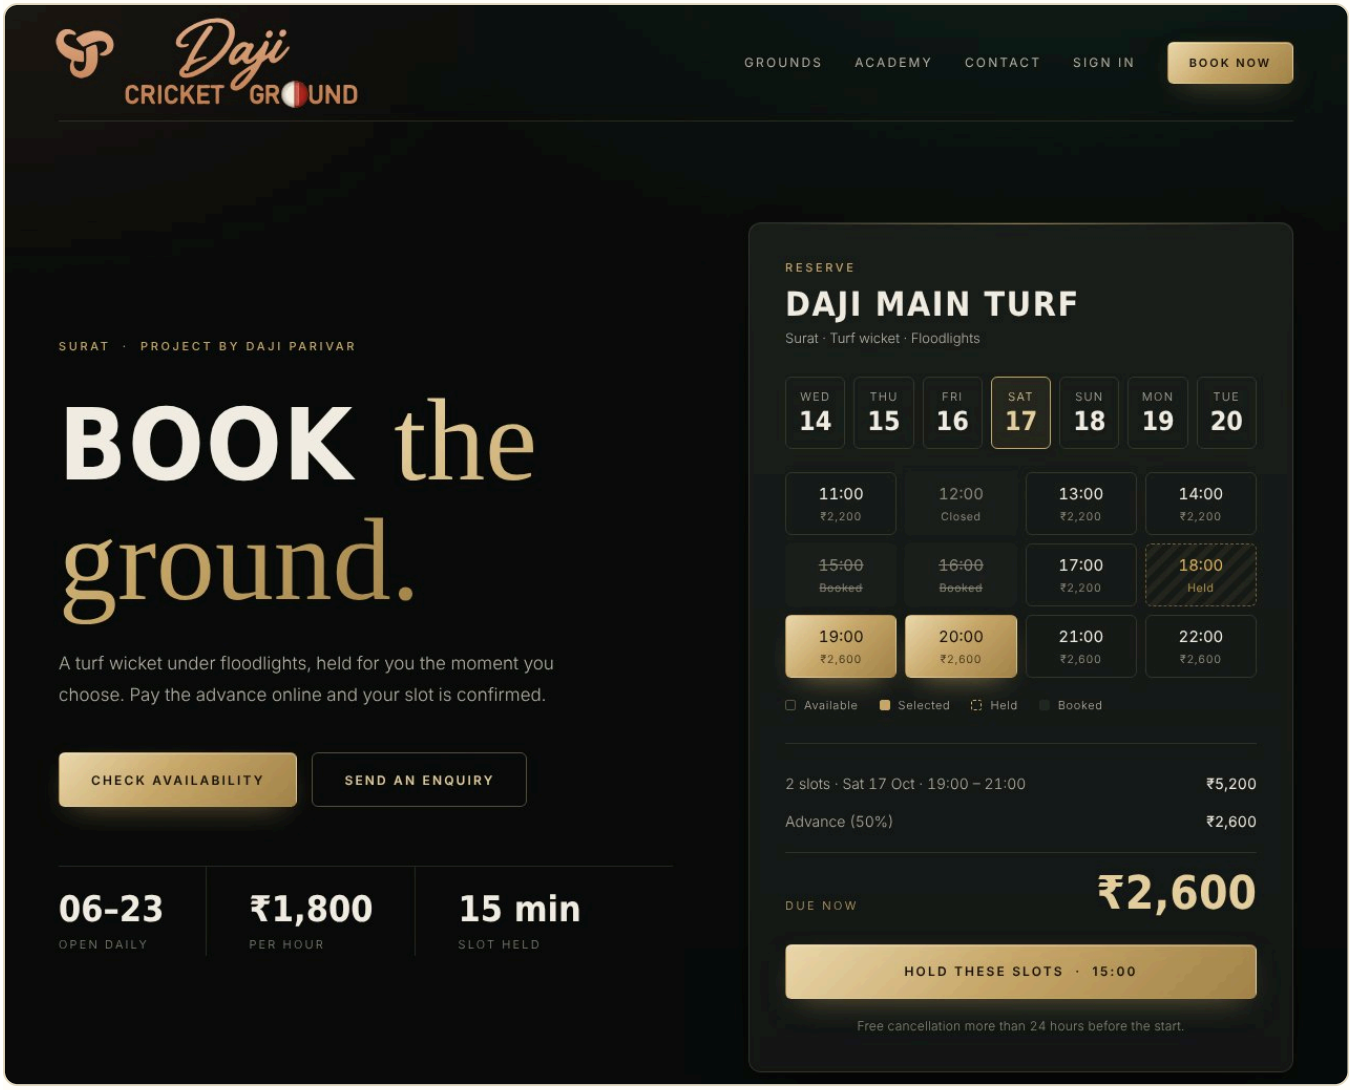

If you add an Anthropic API key, questions the built-in answerer cannot read are passed to Claude, which looks things up using a fixed set of read-only tools on your own books. This is off until you add a key. The built-in answerer is the default and never leaves the server.

Safeguard	Detail
Read-only, your books only	The tools only read; they are limited to the owner whose books are being asked about and to what the asker may see
No personal details leave	Customer names, phone numbers and email addresses are never sent. Email addresses and phone numbers typed into the question are replaced before sending. Sessions are identified only by booking reference
Amounts are checked	Every rupee amount in Claude's reply must match an amount the tools returned. If one does not, the answer is marked "not fully verified" with the amounts to double-check
Bounded	At most 6 look-ups per question and a time limit; if Claude fails, times out or is unreachable, the built-in answerer answers instead
Fair use	30 questions per person per hour (a setting); the question text (shortened) is logged for audit, the answer is not

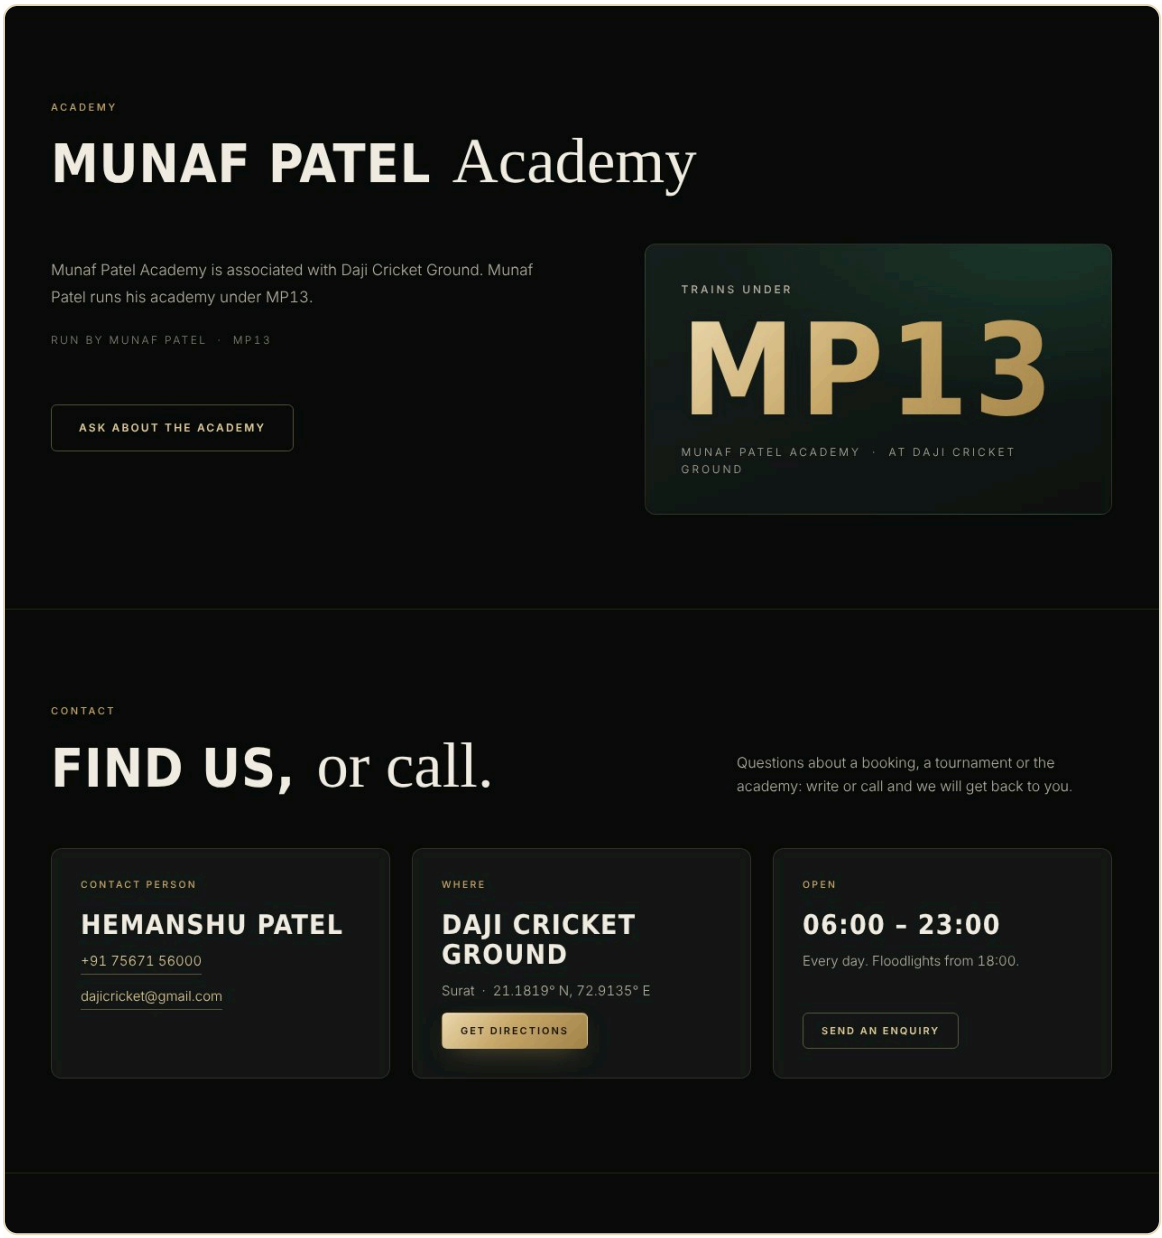

> **Not tested against the real Claude service.** Claude mode was tested only against a stand-in server that behaves like the published interface. Please try it once with a real key.

10. Look and brand

"**Obsidian & Champagne**": a near-black canvas with a faint green, champagne-gold lines and accents, warm ivory text, and bronze from the copper sign at the ground. The lettering follows the sign: a flowing brush script for "Daji" and for accent words, bold condensed capitals for "CRICKET GROUND" and headings, and a quiet sans-serif for everything you read or add up. The O in GROUND is the half-red, half-white cricket ball. An ivory (light) version of the same palette is built in for printing and for people who prefer a light screen.

Design preview of the booking screen. The preview uses stand-in fonts because the web fonts could not be downloaded here; the real screens use the brush script and condensed capitals.

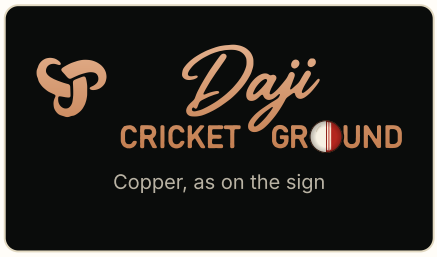

Academy and Contact sections: MP13 Academy (its own page) under MP13, the contact person, phone, email and the Get Directions button.

The logo

Your logo is used as the flat, clean mark with the backlit glow removed, so it sits directly on the page background with nothing around it. There are flat variants for different backgrounds; the copper one matches the sign.

Champagne gold, on dark (default on dark pages)

Copper, as on the sign

Ink, for light pages and print

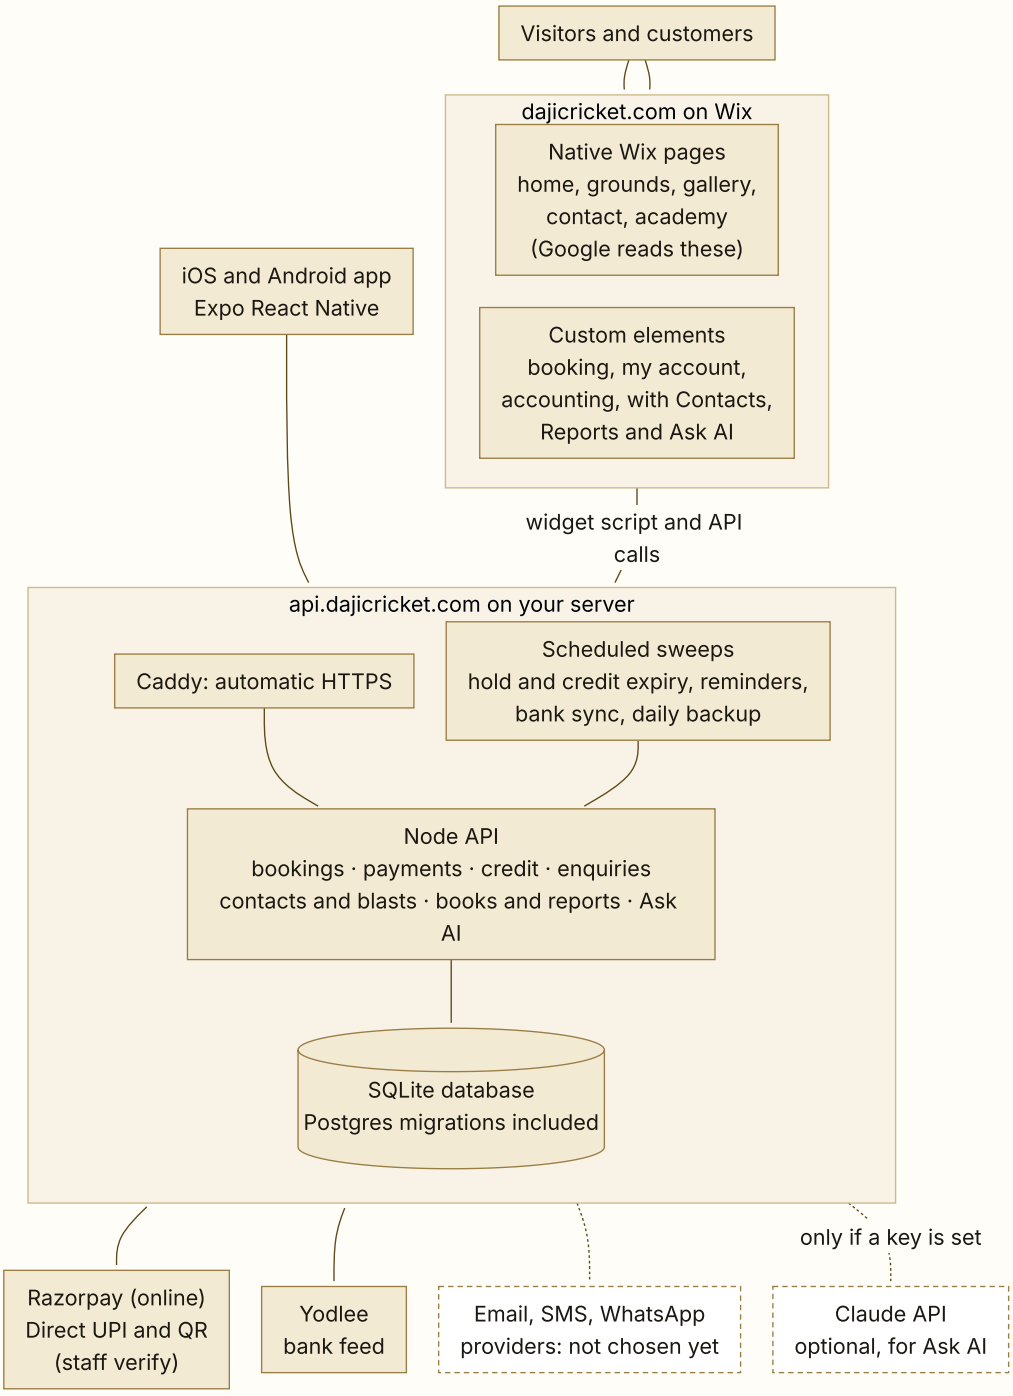

> **Fonts are an approximation.** The wordmark was traced from your drawing and the headings use a similar condensed face; the real fonts of the sign are not known. If you have the artwork files or font names from the sign painter, send them.

Palette

#0a0c0b	#141816	#123b2d	#c9a96b	#e6d09f	#b8805c	#f3eee3	#df7d6e
Obsidian	Surface	Emerald	Champagne	Champagne light	Bronze	Ivory	Alert

- **Type:** brush script for "Daji" and accent words; bold condensed capitals for headings; Inter for body text and figures.
- **Tagline:** "Project by Daji Parivar", under the name on the website, the app and messages.
- **One source:** the colours and fonts live in one file that feeds the website, the app and exported reports, so they cannot drift apart. To apply them in Wix, use the colours above; whether Wix's font library has the same fonts is not checked (font files may need uploading).

11. How it is built, and how it works with Wix

Why the server sits outside Wix

Wix cannot run this project's Node server, and the booking guarantee (the database refuses two bookings for the same ground and slot, even if the application is wrong) and the accounting work (reading uploaded bank files, calling Yodlee) need a real database and server. So the system is split in two: Wix keeps the public pages (home, grounds, gallery, contact, academy), which Google can read, and the booking, account and accounting screens are added to Wix pages as **custom elements** loaded from `api.dajicricket.com`. The Expo app and the Razorpay webhooks talk to the same address.

Part	Choice
Backend	Node.js 22 with TypeScript, using only what ships with Node (`node:http`, `node:sqlite`, `node:test`). No outside packages, because the package registry cannot be reached from the build environment
Database	SQLite file with a daily backup (section 21), 39 tables. A Postgres migration set is planned for when the platform outgrows one server
Website	Wix pages plus custom-element widgets (booking, my account, accounting with Contacts, Reports and Ask AI), built in the new look. The screens themselves already exist as plain HTML, CSS and JavaScript served by the server, and are what the widgets will wrap
Mobile	Expo (React Native). Source will be written here, but Expo cannot be installed in the build environment, so the app cannot be built or run here (section 14)
Shared code	One package of types, money helpers and brand tokens used by the API, widgets and app, so all three agree on every field
Hosting	A small server running Docker and Caddy for automatic HTTPS, reachable at `api.dajicricket.com` (a DNS record added in Wix)
Errors	Every error has the same shape: a code, a message and, for bad input, the list of fields at fault

What Wix requires

Need	Detail (from Wix's documentation)
Plan	Custom elements on a live site need a Premium plan, a connected custom domain and no Wix ads
HTTPS	Externally hosted custom elements need HTTPS for the script and the API
Editor and preview	In the editor and preview a custom element runs from a different address than on the live site, so the server's allow-list may need that address added. The first blocked address is logged so it can be copied in
SEO	Keep the real text on native Wix elements; Google may not read text inside a custom element
DNS	Wix Domains, Manage DNS Records: add host `api` pointing at the server. Changes can take up to 48 hours

.NET terms mapped to Node

You asked for	What is used instead
Hangfire nightly jobs	A scheduled sweep inside the server (hold expiry, credit expiry, reminders, recurring entries, daily backup; bank sync once Yodlee is added)
Mapster mapping	Plain mapper functions from database rows to API shapes
Respawn database reset	A test helper that resets the database before each test
xUnit collections	One database per test file, run in parallel processes
EF Core migrations	Versioned schema steps in the server; generated Postgres SQL (up and down) later

If you later want a C# version, say so and it can be done as a separate piece.

12. Data kept, and security

Table	Holds
users	Customers, owners, staff, super admins; permissions; marketing consent per channel
grounds	Details, map link, facilities, hours, slot length, prices (weekday, weekend, evening surcharge), advance override
bookings, booking_slots	Bookings and their status; one row per held or booked slot with a unique key on ground plus slot start
payments, payment_events, refunds	Every payment with method and status, its full history, and every refund
credit_lots, credit_ledger	Credit lots with expiry, and the ledger of every change
enquiries, enquiry_notes, quotations	Enquiry status, contact notes and quotations
notifications	Every message with channel, category and whether it was sent, queued or skipped
broadcasts, broadcast_recipients	Each update sent from Contacts, who it was aimed at, who was queued and who was skipped and why
audit_log	Who did what and when: booking, payment, cancellation, credit, settings, exports, consent changes, Ask AI questions
settings, webhook_events	Global settings (including the contact and academy details); payment webhooks already processed (so a repeat is ignored)
Accounting tables	Bank and cash accounts, transactions, categories, rules, journals and their lines, month sign-offs and memos, attachments, statement imports, recurring entries; with soft delete and audit columns
Academy, matches, leads, mfa	Batches, students, attendance, fees, progress; matches and every ball; platform leads; authenticator secrets

Security design

- Passwords are hashed with scrypt; login tokens are signed and can be revoked by bumping a per-user version.
- Every request checks role and permission on the server; owner data is separated by owner, and another owner's record answers "not found" rather than "forbidden".
- Razorpay webhooks are signature-checked over the raw bytes and processed once; direct UPI cannot confirm a booking without an authorised verifier.
- Updates to customers are consent-checked per channel, previewed, confirmed by number, capped per day and de-duplicated; unsubscribe links are signed.
- Ask AI only reads, only for the owner in question, never sends personal details to Claude, and every amount in a Claude reply is checked.
- Month-end locks stop quiet changes to figures that have been signed off.
- Rate limits on sign-in and registration; request size limits; uniform validation errors.
- Demo accounts and the fake payment gateway exist only on localhost or when explicitly turned on; the server warns loudly if demo mode is on for a real domain.
- Optional two-step sign-in with an authenticator app (6-digit codes, 30-second steps) for owners, staff and the super admin.

- Browser headers: HSTS for two years, no framing, no content sniffing, same-origin opener policy, strict referrer policy.
- Uploaded receipts and statements are size-limited, type-checked, stored per owner and never served to another owner.
- Secrets come from environment variables, never from code. The Anthropic key, Razorpay keys and the login secret are all settings.

> Each of these is exercised by automated tests in this build, except where section 14 says otherwise. Section 19 lists what is still open.

13. Going live on dajicricket.com

#	Step
1	Get a small server with a fixed IP address and Docker. In **Wix Domains, Manage DNS Records**, add an **A record for host `api`** pointing to that IP (Wix keeps `dajicricket.com` itself)
2	Set the environment: `PUBLIC_URL=https://dajicricket.com`, `API_URL=https://api.dajicricket.com`, a long random `JWT_SECRET`, `TRUST_PROXY=1`, `CORS_ORIGINS` listing `https://dajicricket.com`, `https://www.dajicricket.com` and the Wix editor address when known. Leave demo mode off
3	Start with Docker Compose; Caddy gets the HTTPS certificate by itself. Check `https://api.dajicricket.com/api/health` answers
4	Create the first super admin with the `create-admin` script (password typed at a prompt, at least 12 characters)
5	Wix: upgrade to a Premium plan with the domain connected; add each custom element (Add, Embed code, Custom element, Server URL `https://api.dajicricket.com/embed/daji-widgets.js`) on its own page; apply the brand colours and fonts
6	Razorpay: add keys in test mode; set the webhook to `https://api.dajicricket.com/api/webhooks/razorpay` with events payment.authorized, payment.captured, payment.failed, order.paid, refund.processed, refund.failed
7	Each owner enters their own UPI ID; the super admin sets the global Razorpay switch and checks the contact and academy details
8	Optional: add `ANTHROPIC_API_KEY` to switch on Claude for Ask AI (settings `AI_MODE`, `AI_MODEL`, `AI_LIMIT_PER_HOUR`, `AI_TIMEOUT_MS`)
9	Backups run daily at 03:15 India time (section 21). Copy the backups folder off the server as well; restore steps go in the deployment guide

Accounts you need to arrange

- A server (any small VPS) and control of the dajicricket.com DNS in Wix.
- A Wix Premium plan with the custom domain connected (needed for custom elements on the live site).
- A Razorpay account (test mode is enough to start) and a UPI ID or QR for each owner.
- A Yodlee account if you want the live bank feed. Confirm with Yodlee that your plan covers your Indian banks; statement upload will work without it.
- Email, SMS and WhatsApp providers, once you pick them — needed before any Contacts update is actually delivered.
- Optional: an Anthropic API key, for Claude in Ask AI.
- To publish the apps: an Apple Developer account and a Google Play developer account.

14. What is verified and what is not

This is the honest list. "Verified" means it was run, not just written.

Item	Status	Detail
Booking, payments, cancellation, credit, expiry, enquiries, staff and roles	Tested	319 automated tests pass in about two minutes, including permissions, owner isolation, rate limits and configuration rules
Contacts and updates	Tested	Filters, consent per channel, preview, confirm count, daily limit, repeat protection, history and unsubscribe are tested. Delivery is not (no provider)
Books, Profit and Loss, Balance Sheet, schedules	Tested	Tested on a scenario with played, owing, no-show, late-cancelled, free-cancelled, future and other-owner bookings: the Balance Sheet balances and the schedules tie to the Profit and Loss. Not tested on real books from your ground
PDF, Excel and CSV exports	Partly	Read back by the automated tests; PDFs checked for content. Opening and recalculating the Excel files in LibreOffice or Excel has not been repeated
Ask AI, built-in answerer	Tested	35 tests: dates, topics, permissions, owner isolation, rate limit, audit
Ask AI with Claude	Not run	Tested only against a stand-in server that behaves like the published interface; never against the real service
Website, owner desk, Books, Academy, Live scores, platform page	Run	Opened in a real browser against the real server and clicked through, and again in the hosted preview with sample data. Contacts has no full screen yet
Bank-statement import and reconciliation	Fixtures only	Tested on generated statements, not on your bank's real layout. PDF statements are deliberately not read
Backups, encryption at rest	Tested	Snapshot, clean-up, encrypted snapshots, restore with the right and wrong passphrase, and sealed fields are tested. A restore on a new server has not been rehearsed
"Reply STOP" on SMS and WhatsApp	Gap	The message says it, but replies are not read yet (section 7)
Wix widgets	Test page only	Nine widgets (booking, account, owner desk, scores, grounds, gallery, academy, contact, platform) were embedded in a plain page on another address and used. Not inside Wix itself; no Wix account here.
Wix site	Not run	No Wix account here: nothing has been run on a real Wix site, the editor and preview addresses are not known for certain, and Wix's font library has not been checked
Docker image and HTTPS through Caddy	Not run	There is no Docker daemon in the build environment. The files will be written and checked by reading, not by building
Real Razorpay	Not run	Only the built-in demo gateway and hand-signed webhooks can be tested here

Bank feed pipeline	Tested	Pulled transactions go through the same import as a statement (no duplicates, rules, UPI matching, locked months). Tested with the demo feed and a stand-in Yodlee server that checks the signed token
Real Yodlee	Not run	No Yodlee account here. The connect-your-bank step (FastLink) is not built; the bank is linked in Yodlee and its id is entered in the books
Real bank statements	Not run	Send two or three redacted CSV or Excel statements and the column matching can be tuned. PDF statements are not read; ask your bank for CSV or Excel
Email, SMS, WhatsApp, push	Not connected	Messages are recorded with the right category and consent check; nothing is actually sent until providers are configured (broadcasts stay "queued")
Logo and fonts	Approximate	The wordmark was traced from the drawing; the headings use similar fonts, not the sign painter's
Expo app	Not run	The source is written (sign in, book and pay, dashboard with the Ground/Academy toggle, Ask AI, owner desk) but Expo could not be installed here, so it was never run on a phone or simulator

16. The website you can open today

Besides the API, the server now serves a **complete website** built in the Obsidian & Champagne look. It runs on its own today (on your laptop or any server) and is the same set of screens that will be placed inside Wix. A hosted preview with sample data was also published so the screens can be clicked through without installing anything; nothing done there is saved.

Screen	What it does
Home and booking	Hero, ground picker, a date strip and a date box that reaches **up to a year ahead**, slot grid with live availability, price summary. Choosing slots and pressing Hold or Book now takes a visitor who is not signed in to the **sign-in / create account** page and then straight back to the booking
Grounds, Gallery, Academy, Contact	Ground cards with facilities and prices; a photo gallery and Instagram buttons that appear once links are added in the admin desk; the Academy section (Munaf Patel Academy, MP13); contact person, phone, email and Get Directions
Live scores	Public match list and scorecards, with a Watch on YouTube link beside the score (section 17)
My dashboard (customers)	After sign-in a customer lands here: **what they have spent at the ground**, sessions and slots played, money paid ahead for sessions not yet played, spend for each of the last 12 months, spend per ground, and their full booking history with cancel. Only money that stayed with the ground counts as spent: a cancellation counts what was kept, not what was refunded or returned as credit
Ask AI for customers	A question box on the dashboard that answers from the customer's **own** bookings and credit and from public ground details: next booking, what is still to pay, credit and when it expires, free slots on a day, prices, opening hours, directions, the cancellation rules and how they apply to their next booking. Built-in answerer only; it cannot make or change a booking and never sees anyone else's data
Academy toggle	If the account belongs to a parent, or to a student of 16 or over, the dashboard shows **Ground** and **Academy** buttons. One login can hold several children, with a button for each child (section 17)
Owner desk	Tabs for Today (figures for today and this month, Ask AI), Books, Academy and Matches; the admin desk also holds the website details (Instagram, gallery links), global switches, backups and the leads list (section 20)
Timings	Owners change opening and closing time, slot length, evening-rate start and most slots at once, per ground
Phones	All screens work at phone width. A menu button opens Grounds, Gallery, Academy, Contact, Sign in and Book now

Demo accounts (only while demo mode is on, never on a real domain): customer, owner, staff and admin, each with a sample password shown on the sign-in page. Demo mode also provides the fake payment gateway, so a booking can be paid end to end without Razorpay.

Still approximate: the fonts are close, not the sign painter's; the gallery uses photo links, because there is no upload yet; the Instagram address has not been supplied; Contacts has no full screen yet (its API and export work). The look was checked in a browser at phone width, not on a physical phone.

17. Academy and match day

17.1 Academy

Part	Detail
Students	Profile with date of birth, batch, guardian name, phone and email, photo and video consent flags, status active or left. Kept per owner; another owner's students answer "not found"
Attendance and progress	Bulk attendance by day (no future days, corrections allowed); a monthly progress card with five skills the owner names (default Batting, Bowling, Fielding, Fitness, Discipline) rated 1 to 5 with a comment. A card is private until the coach **publishes** it, and can be taken back
Who can use it	Owner and coach. A **Coach** preset gives academy access only; front-desk staff and customers have none
Parent access	A parent sees a child only after **staff link** the parent's account to the child; an email match alone is not enough, because sign-up does not verify email addresses. The parent sees only published cards and the attendance count
Several children, one login	Staff link each child to the same account. The parent's dashboard has a button per child
Students of 16 and over	Staff can link a student's own account to their record, only if a date of birth is recorded and the student is 16 or older today. The student then sees the same dashboard, with their own progress under Academy. Younger students are seen only through a parent
Ground and Academy toggle	One login switches between the Ground view (bookings, spend) and the Academy view. The last choice is remembered on that device

> **Not built:** photo and video upload per student. The consent flags are stored, but nothing is uploaded, so nothing can be shared by mistake. Written guardian consent, retention rules and a withdrawal process are still the academy operator's to arrange before any photo of a child is shared (section 22).

17.2 Match day

Part	Detail
Scoring	Staff with the matches permission create a match (teams, overs, players per side) and score **ball by ball**: runs, wides, no-balls, byes, leg byes and wickets, with undo. Innings totals, the chase and the result are worked out from the balls, so a correction always re-flows
Public pages	The public Live scores section and full scorecards, with no sign-in
Video	An owner can attach a **YouTube Live** link to a match. Only real https YouTube links are accepted. The site links out to YouTube; it does not receive or record video
Not connected	CricHeroes: no synchronisation (it needs API access from them). Automatic stream setup is not part of the software

18. Accounting additions

These complete the part that section 8 originally listed as "Next". Invoices, bills and customer or vendor balances were **left out on purpose**, as you asked.

Feature	What it does
Exports	Every report downloads as **PDF**, Excel (with working totals) or CSV
Receipts and documents	Attach a receipt, screenshot or deposit slip to any transaction (file size and type are checked; files are kept per owner; removing one unlinks it but keeps the stored bytes for the audit trail and backup). Attachment counts show on the list
Bank statement import	Upload **CSV or Excel** from your bank, pick the account and preview before importing. Columns are matched by heading across common Indian layouts; opening and closing balances are checked; running-balance gaps are flagged. **PDF statements are deliberately not read**: guessing columns from a PDF can put wrong money into your books. Ask the bank for CSV or Excel
No duplicates	Every line gets a fingerprint, so the same statement uploaded twice adds nothing. An import can be undone
Rules	"If the description contains X, categorise as Y". Rules run on import and can be re-applied
Automatic UPI reconciliation	After every import the software matches bank credits to UPI bookings by **UTR number and amount**, one bank line to one payment only. What matches is marked reconciled and leaves "Needs attention"; the rest stays for you with a Match and Unmatch button. The Reconcile tab shows the difference between your books and the statement
Recurring entries	Rent, wages or a loan instalment as a schedule (weekly, monthly, quarterly or yearly); the daily sweep posts what is due
Cash flow statement	Money in and out of the bank and cash accounts for a period, split into running the ground, equipment bought, and owner money and loans. It is checked against the balance sheet and says so when it ties
Budgets	Set a monthly amount for any income or expense line; the budget report compares it with what really happened, month by month, and marks each line On track, Over, Under or No budget
Moving money between accounts	Cash taken to the bank, or bank to petty cash, as one action. It is not income or expense and nets to zero in the cash flow
Fixed assets and depreciation	A register of the bowling machine, nets, roller and so on, with straight-line depreciation posted automatically for each finished month (signed-off months are skipped and reported). Sold or scrapped assets stop depreciating. Buying an asset is categorised as "Equipment or asset bought", so it is not counted as an expense
GST summary	By month: sales before GST, GST collected, GST paid, and the amount payable, matching the balance sheet. It is a working summary for you and your accountant, not a filed return
Screens	The owner desk Books tab has thirteen sub-tabs: Overview, Reports, Cash flow, Budget, GST, Assets, Transactions, Bank import, Reconcile, Recurring, Journals, Month-end and Setup. The new reports download as PDF, Excel or CSV

Be clear about what automatic means. Matching happens when you *upload a statement*. A live bank feed (Yodlee or the Account Aggregator) is **not connected**, so money appears in the books only after you import. Real bank layouts were tested only on generated statements: please send two or three redacted real statements so the column matching can be tuned.

19. Security: what exists and what is still open

In place and tested	Detail
Passwords and tokens	scrypt hashing; signed tokens that can be revoked; sign-in and registration rate limits
Two-step sign-in	Optional authenticator-app codes (6 digits, 30-second steps) for owners, staff and the super admin
Access control	Every request checks role and permission on the server; owner data is separated and another owner's record answers "not found"
Browser protection	HSTS for two years, no framing (except the Wix page you allow), no content sniffing, same-origin opener policy, strict referrer policy, and a **strict content policy**: scripts only from the site itself and Razorpay, no inline scripts, no plug-ins
Encrypted two-step secrets	With `FIELD_KEY` set, authenticator secrets are stored encrypted (AES-256-GCM). Tampering is detected. Older plain values still read and are sealed when next written
Encrypted backups	With `BACKUP_PASSPHRASE` set, every file in a snapshot is encrypted (AES-256-GCM, key from the passphrase). A restore script decrypts it, checks the database, and refuses a wrong passphrase. Keep the passphrase away from the server
Payments	Razorpay webhooks signature-checked and processed once; UPI cannot confirm without a verifier
Files	Uploads size-limited and type-checked, stored per owner, never served to another owner
Audit and locks	Who did what is recorded; signed-off months are locked

Still open	Detail
HTTPS	Caddy in the Docker kit gets the certificate once DNS points at the server. Not yet run on a real server
Encrypted disk	Choose an encrypted disk at the hosting provider; the software encrypts the backups and the two-step secrets, not the whole database file
Other personal fields	Phone numbers, emails and bank details are not individually encrypted in the database; they are protected by the encrypted disk and access rules
Independent review	No outside security test has been done. "Highest level of encryption" is a goal reached by hosting choices plus these items, not something one setting provides

20. The platform page, and a comparison with your SaaS brief

The home page footer links to **For ground owners**: a page offering the software to other owners, with a form (ground name, city, phone, email, number of grounds, message). Submissions are kept as **leads** that the super admin sees in the admin desk and moves through *new, contacted, demo, won, lost*. Pricing is agreed directly; there is no self-serve sign-up or billing.

The brief you attached describes the product as a tenant-isolated SaaS MVP. Compared with this build:

Area	Your brief	This build	Suggested decision
Isolation	A separate SQLite database per tenant, resolved by host name	One database; every record carries its owner and every route checks it. Tested for each module	Keep for now. Per-tenant databases matter at many tenants, or if a customer demands it
Platform console	Tenants, plans, quotas, domain approval, platform audit	Leads list, global settings, audit log. No tenant provisioning, plans or quotas	**Gap.** Build when the first outside owner signs. Your call on timing
Custom domains	DNS TXT verification, certificates by Caddy	Not built. One address, `api.dajicricket.com`	**Gap.** Only needed for other owners' own domains
Roles	Platform admin, owner, general manager, staff/coach, customer/parent	Super admin, owner, staff with chosen permissions (presets such as Coach), customer	Equivalent. A General Manager is a staff preset with most permissions
Two-step sign-in	Optional TOTP	Optional TOTP for owners, staff, admin	Match
Statement import	CSV, Excel and text-based PDF	CSV and Excel; PDF refused on purpose	Keep. Ask banks for CSV or Excel
Reconciliation	Duplicate check, running balance, reference matching, review queue	Same, plus automatic UTR and amount matching of UPI money	Match or better
Contacts	Email BCC and one-at-a-time WhatsApp drafts	Consent-checked, previewed updates with limits; manual-send mode; nothing delivered until a provider is chosen	Match. Choose providers
Academy	Roster, five skills, guardian-email access, publish, **photo and video gallery**	Everything except photo and video upload; parent access by staff link, not by email match; students 16+ can have a login	**Gap:** media upload. Wait for consent and storage decisions
Match day	Ball-by-ball, public page, YouTube embed	Same	Match
Ask AI	Built-in answers; no external model	Built-in for owners and for customers; optional Claude mode for owners, not yet tried against the real service	Ahead. Decide whether to switch Claude on
Backups	Daily 03:15 including media	Daily 03:15; database and uploads; keeps the newest 14	Match. Copy off the server

Scale	One host; Postgres is a later step	One host; Postgres migration planned	Match

> **Wix and cost.** The public site can stay on Wix with the booking screens embedded; Wix requires a Premium plan with a connected domain for that. The other option is to serve the whole site from the server, which already works as a standalone website, and drop Wix. Prices of Wix plans and of a small Mumbai server were taken from comparison sites and **not verified here**; check current prices before deciding. My lean: serve everything from one small server and keep Wix only if you want its editor for marketing pages.

21. Backups and everyday operation

- **Daily backup at 03:15 India time**: the database and the uploaded files (receipts), written to a temporary folder, integrity-checked, then renamed so a half-written copy is never mistaken for a good one. The newest 14 are kept. The admin desk shows the schedule and the latest snapshot.
- **A backup on the same disk does not protect against losing the disk.** Copy the backups folder off the server too, and encrypt it first.
- **Restore** is a manual copy of the snapshot back into place. It has not been rehearsed on a second machine; do that once before launch.
- **Daily sweep** inside the server: releases unpaid holds after checking for late payments, expires credit, sends reminders, posts recurring entries and takes the backup.
- **Manual sends and opt-out:** staff can mark a contact as opted out of a channel; manual-send mode prepares messages to be sent by hand and records them as sent.

22. Progress, launch checklist and decisions

Part	Status	Notes
Bookings, payments, cancellation, credit, enquiries, staff, roles	Done	Tested
Ground details, contact, academy, tagline, look	Done	Fonts approximate
Contacts and updates	Done	No provider connected; "Reply STOP" not read
Books, Reports, exports (PDF, Excel, CSV), month sign-off	Done	With screens
Receipts, statement import, UPI reconciliation, rules, recurring entries	Done	Tested on generated statements only
Ask AI (owners and customers)	Done	Claude mode not run against the real service
Website, customer dashboard, phone layout, hosted preview	Done	Checked in a browser, not a phone
Academy, parent and 16+ logins, match scoring, live page	Done	No media upload
Platform page and leads	Done	No tenant provisioning
Two-step sign-in, daily backups	Done	Restore not rehearsed
Live bank feed	Built	Pipeline and Yodlee client tested against a stand-in; real Yodlee and bank linking not done
`api.dajicricket.com` : Docker, Caddy, HTTPS, admin script, off-server backup, restore	Written	Not run on a real server. Stays on SQLite; Postgres not done
Wix custom-element widgets	Built	Tested in a plain page, not in Wix
Expo iOS and Android app	Written	Source only; never run
Contacts full screen	Done	Filters, export, message composer with preview and confirm
Photo upload for gallery, grounds and academy	Done	PNG, JPEG, WebP, GIF up to 6 MB, checked by content; admin desk uploader and academy photo strip
Tenant provisioning, plans, custom domains	Paused	Removed from scope for now at your request
Encrypted backups and secrets, strict content policy	Done	Independent security review still open (section 19)

Launch checklist

Check	Done when
Environment	Production secrets are unique and long; demo mode is off; the first super admin was made with the admin script
DNS and HTTPS	The API address points at the server, ports 80 and 443 are open and Caddy has issued the certificate
Two owners	Two test owners were created and one cannot see the other's bookings, money, files or students

Payments	A full booking, payment, webhook replay and cancellation was run in Razorpay test mode
Recovery	Backups are copied off the server, encrypted, and a restore was tried on another machine

Needs your decision

- Confirm the defaults in section 5 (advance, hold times, credit expiry, refunds, no-shows) and whether prices include GST.
- Choose email, SMS and WhatsApp providers and whether push notifications are in the first release.
- Privacy: customer consent wording, guardian consent for children, retention and deletion, withdrawal process, backup retention.
- Provide privacy policy, cancellation terms, terms of service and the invoice format.
- Send your Instagram address and a few gallery photo links.
- Confirm "Surat" as the address line, and send the sign painter's artwork or font names.
- Say whether to use Claude in Ask AI, and when to revisit tenant provisioning and custom domains (paused for now).
- Send two or three redacted real bank statements (CSV or Excel).
- Name the people who own operations: owner, general manager, support contact, and who runs backup and restore.
- Hosting: Wix with embedded screens, or everything from one server (section 20).
